### 二分类问题的Fisher线性判别:

学习最佳投影 $\mathbf{w}^*$ , 它能将所有样本投影到 $\mathbf{w}^*$ 的方向

假设  $s = \mathbf{w}^T \mathbf{x}$        $\mathbf{x} \in \mathcal{R}^d, s \in \mathcal{R}^1$

类别集合:  $\mathcal{C} = \{c | (1, -1)\}$

第  $c$  个类别的均值为:  $\boldsymbol{\mu}_c = E[\mathbf{x} | y = c] = \frac{1}{N_c} \sum_{n=1}^{N_c} [\mathbf{x}_n | y = c]$

第  $c$  个类别的协方差为:  $\boldsymbol{\Sigma}_c = E[(\mathbf{x} - \boldsymbol{\mu}_c)(\mathbf{x} - \boldsymbol{\mu}_c)^T | y = c]$   
 $= \sum_{n=1}^{N_c} [(\mathbf{x}_n - \boldsymbol{\mu}_c)(\mathbf{x}_n - \boldsymbol{\mu}_c)^T | y = c]$

## 4.2 Fisher线性判别分析

### 二分类问题的Fisher线性判别:

学习最佳投影  $\mathbf{w}^*$  的目标函数:

$$J(\mathbf{w}) = \frac{\text{between class scatter}}{\text{within class scatter}}$$

$$\mathbf{w}^* = \underset{\mathbf{w}}{\operatorname{argmax}} J(\mathbf{w})$$

$$J(\mathbf{w}) = \frac{\mathbf{w}^T \mathbf{S}_B \mathbf{w}}{\mathbf{w}^T \mathbf{S}_W \mathbf{w}}$$

最大化目标函数问题转化为:

$$\max_{\mathbf{w}} \mathbf{w}^T \mathbf{S}_B \mathbf{w} \quad \text{Subject to } \mathbf{w}^T \mathbf{S}_W \mathbf{w} = K$$

利用拉格朗日乘子法(Lagrange multipliers):

$$L(\mathbf{w}, \lambda) = \mathbf{w}^T \mathbf{S}_B \mathbf{w} + \lambda(K - \mathbf{w}^T \mathbf{S}_W \mathbf{w})$$

$$= \mathbf{w}^T (\mathbf{S}_B - \lambda \mathbf{S}_W) \mathbf{w} + \lambda K$$

$$\nabla L_{\mathbf{w}}(\mathbf{w}, \lambda) = \frac{\partial L(\mathbf{w}, \lambda)}{\partial \mathbf{w}} = \mathbf{0}^T$$

$$2(\mathbf{S}_B - \lambda \mathbf{S}_W) \mathbf{w} = \mathbf{0} \Rightarrow \mathbf{S}_B \mathbf{w} = \lambda \mathbf{S}_W \mathbf{w}$$

## 4.2 Fisher线性判别分析

### 二分类问题的Fisher线性判别:

$$J(\mathbf{w}) = \frac{\text{between class scatter}}{\text{within class scatter}}$$

$$\mathbf{w}^* = \underset{\mathbf{w}}{\operatorname{argmax}} J(\mathbf{w})$$

$$J(\mathbf{w}) = \frac{\mathbf{w}^T \mathbf{S}_B \mathbf{w}}{\mathbf{w}^T \mathbf{S}_W \mathbf{w}}$$

$$\max_{\mathbf{w}} \mathbf{w}^T \mathbf{S}_B \mathbf{w} \quad \text{Subject to } \mathbf{w}^T \mathbf{S}_W \mathbf{w} = K$$

$$L(\mathbf{w}, \lambda) = \mathbf{w}^T \mathbf{S}_B \mathbf{w} - \lambda(\mathbf{w}^T \mathbf{S}_W \mathbf{w} - K)$$

$$\nabla L_{\mathbf{w}}(\mathbf{w}, \lambda) = \mathbf{0}^T$$

$$\mathbf{S}_B \mathbf{w} = \lambda \mathbf{S}_W \mathbf{w}$$

如果  $\mathbf{S}_W^{-1} = (\boldsymbol{\Sigma}_1 + \boldsymbol{\Sigma}_{-1})^{-1}$  存在,则有:

$$\mathbf{S}_W^{-1} \mathbf{S}_B \mathbf{w} = \lambda \mathbf{w}$$

$$\mathbf{S}_W^{-1} (\boldsymbol{\mu}_1 - \boldsymbol{\mu}_{-1}) (\boldsymbol{\mu}_1 - \boldsymbol{\mu}_{-1})^T \mathbf{w} = \lambda \mathbf{w}$$

$$\mathbf{S}_W^{-1} (\boldsymbol{\mu}_1 - \boldsymbol{\mu}_{-1}) a = \lambda \mathbf{w}$$

$$\mathbf{S}_W^{-1} (\boldsymbol{\mu}_1 - \boldsymbol{\mu}_{-1}) = \frac{\lambda}{a} \mathbf{w}$$

只关注投影向量的方向:

$$\mathbf{w}^* = \mathbf{S}_W^{-1} (\boldsymbol{\mu}_1 - \boldsymbol{\mu}_{-1})$$

## 4.2 Fisher线性判别分析

### 二分类问题的Fisher线性判别:

学习最佳投影  $\mathbf{w}^*$  的目标函数:

$$J(\mathbf{w}) = \frac{\mathbf{w}^T \mathbf{S}_B \mathbf{w}}{\mathbf{w}^T \mathbf{S}_w \mathbf{w}}$$

$$\max_{\mathbf{w}} \mathbf{w}^T \mathbf{S}_B \mathbf{w} \quad \text{Subject to } \mathbf{w}^T \mathbf{S}_w \mathbf{w} = K$$

$$L(\mathbf{w}, \lambda) = \mathbf{w}^T \mathbf{S}_B \mathbf{w} - \lambda(\mathbf{w}^T \mathbf{S}_w \mathbf{w} - K)$$

$$\nabla L_w(\mathbf{w}, \lambda) = \mathbf{0} \Rightarrow \mathbf{w}^* = \mathbf{S}_w^{-1}(\mu_1 - \mu_{-1})$$

找到投影向量后, 对任一测试样本  $\mathbf{x}$ :

$$s = \mathbf{w}^{*T} \mathbf{x} = (\mathbf{S}_w^{-1}(\mu_1 - \mu_{-1}))^T \mathbf{x}$$

假设类别的判别门限设为  $s'$ :

$$s' = \frac{\mathbf{w}^{*T}(\mu_1 + \mu_{-1})}{2}$$

对任一测试样本  $\mathbf{x}$  所属类别的判断:

$$\begin{cases} y = 1 & \text{if } s = \mathbf{w}^{*T} \mathbf{x} > s' \\ y = -1 & \text{if } s = \mathbf{w}^{*T} \mathbf{x} < s' \end{cases}$$

### 二分类问题的Fisher线性判别算法:

① 获取具有标签的两类样本

② 依据下式得到 $\mu_1$ 和 $\mu_{-1}$ :

$$\mu_c = \frac{1}{N_c} \sum_{n=1}^{N_c} [\mathbf{x}_n | y = c]$$

③ 依据下式得到 $\Sigma_1$ 和 $\Sigma_{-1}$ :

$$\Sigma_c = \sum_{n=1}^{N_c} [(\mathbf{x}_n - \mu_c)(\mathbf{x}_n - \mu_c)^T | y = c]$$

④ 计算类内总离差阵:  $S_w = \Sigma_1 + \Sigma_{-1}$

⑤ 计算类内总离差阵的逆:  $S_w^{-1}$

⑥ 计算最佳投影:  $\mathbf{w}^* = S_w^{-1}(\mu_1 - \mu_{-1})$

⑦ 计算判别门限 $s'$ :  $s' = \frac{\mathbf{w}^{*T}(\mu_1 + \mu_{-1})}{2}$

⑧ 对任一测试样本  $\mathbf{x}$ :

$$\begin{cases} y = 1 & \text{if } s = \mathbf{w}^{*T} \mathbf{x} > s' \\ y = -1 & \text{if } s = \mathbf{w}^{*T} \mathbf{x} < s' \end{cases}$$
